01 The Energy Ghost, Defined

An Energy Ghost is real thermal energy a structure has already lost to the sky — energy that left no entry on any ledger, generated no record, and was never counted.

Every heated or cooled structure sheds energy continuously. Some of that loss is metered and billed; the rest simply radiates away, unmeasured, and vanishes from every account. That unrecorded loss is the **Energy Ghost**: a physically real quantity of thermal energy that occurred, mattered, and was never written down. Bedrock FAD exists to find it — not the loss happening now, but the losses that have **already happened** and are preserved in the public record waiting to be read.

> *Think of a building that has been quietly leaking heat for years. No one installed a meter on that leak, so it never appeared on a bill or a report. But the sky saw it — satellites recorded the building's temperature, day after day, the whole time. The heat is gone, but the evidence of it is archived. Bedrock FAD is the forensic accountant that opens those archives and reconstructs the loss that no one booked.*

THE DISTINCTION

Aethexer computes the Energy Ghost from current observation. Bedrock FAD performs the same derivation in **retrospect** — sweeping years of archived public telemetry to discover liability that already exists but has never been recognized. It is discovery, not projection.

02 The Three-Year Retroactive Audit

Public satellite and utility archives do not expire. Thermal observations, grid-intensity factors, and atmospheric records are retained for years and remain fully resolvable after the fact. Bedrock FAD treats this archive as a crime scene that has already been photographed from orbit — and runs a disciplined forensic sweep across it.

1. **Scope the window.** A facility's footprint and material class are fixed to a defined span of archived record — a standard sweep reaches back three years, the window over which public thermal and utility data remains densely resolvable.
2. **Reconstruct the skin, historically.** For every interval in the window, the Sovereign Skin is rebuilt from the archived surface temperature, emissivity, and sky condition — exactly the Aethexer derivation, run against the past rather than the present.

3 **Integrate the loss.** The interval-by-interval radiative loss is summed across the full window, producing the total Energy Ghost that accumulated over those years — a single, defensible quantity of unrecorded thermal energy.

4 **Close to standard.** The accumulated figure is reconciled to its carbon equivalence under ISO 14064, carrying its provenance back to the public source records so the result is auditable end to end.

FORENSIC, NOT ESTIMATED

This is not a model that guesses what a building "probably" lost. Each interval is a derivation from a specific archived observation. The output is a reconstruction built from records that already exist — the same standard a forensic auditor applies to a paper trail, applied instead to the thermal record the planet has been keeping all along.

03 The Authority Matrix — Why No Permission Is Required

Bedrock FAD reads only the public record. Every input it uses is already open, already archived, and already authoritative. There is no proprietary sensor to install, no facility to enter, and no private system to query — and therefore no permission to obtain.

SOURCE OF AUTHORITY	WHAT IT PROVIDES	ACCESS BASIS
EPA	Grid-intensity factors and regulated emissions baselines for carbon reconciliation.	Open public registry.
ESA / Copernicus	Archived satellite thermal observation resolved to the facility footprint, across years.	Open Earth-observation archive.
NOAA	Historical atmospheric and meteorological series that resolve the sky condition for each interval.	Open public record.
ISO 14064	The international standard the discovered loss is closed to.	Recognized methodology.

THE AUTHORITY BASIS

The right to perform the audit does not derive from access to any party's private property. It derives from the fact that the physics is objective and the records are public. Bedrock FAD does not ask whether a loss may be examined — the evidence is already in the open, and the physics does not require consent to be correct.

04 The Regulatory Bridge — SEC ESG & §179D

A discovered Energy Ghost is not an abstraction; it maps directly onto frameworks regulators already use. Bedrock FAD is designed to express its findings in the exact language of mandated disclosure and established tax code, so a forensic result lands as a recognized figure rather than a novel one.

1. **SEC ESG disclosure.** As climate-related disclosure moves from voluntary narrative to mandated, auditable reporting, an unrecorded thermal liability is exactly the kind of figure that must be surfaced. Bedrock FAD produces a quantity with full provenance — disclosure-grade by construction, not a marketing claim.

2. **§179D energy-efficiency framework.** The U.S. tax code already recognizes quantified building-energy performance under §179D. A forensically discovered loss is denominated in the same physical terms the framework operates on, letting discovery connect to an established mechanism rather than an invented one.

SPEAKING THE REGULATOR'S LANGUAGE

The power of a forensic figure is that it does not require a new rulebook to be believed. It arrives in ISO 14064 carbon terms, traceable to public records, and expressible within SEC disclosure and §179D frameworks that already exist. The discovery is new; the language it is written in is not.

05 From PDF Greenwashing to Guaranteed Liquidity

The prevailing form of a carbon claim today is a document — a report asserting a number, trusted because of who signed it. A PDF can be edited, re-stated, and is only as good as the trust placed in its author. It is an **assertion**, not a proof.

Bedrock FAD replaces the assertion with a derivation. A discovered Energy Ghost is computed from public physics, closed to an international standard, verified by Hash-Match, and anchored immutably through

Echo-Ex. At that point the claim is no longer a document to be trusted — it is a **mathematically guaranteed, tamper-evident record** that any party can verify against the open chain.

LEGACY ESG CLAIM	FORENSIC DISCOVERY
A signed PDF	A derivation from public telemetry
Trusted by reputation	Verified by Hash-Match against source
Editable after the fact	Immutable once anchored on-chain
An assertion	A proof

> *The difference is the difference between someone telling you a vault contains gold and being able to open the vault and weigh it yourself. Greenwashing asks for trust. Forensic discovery hands you the scale.*

06 Position in the Ecosystem

Bedrock FAD is the discovery layer of the sovereign stack. Bedrock ESG gathers the record; Aethexer derives the physics; Echo-Ex anchors the settlement; Bedrock FAD turns the archive of the past into recognized, settleable liability — reaching backward where the others reach forward.

POSITION IN THE ECOSYSTEM

Across the built environment, an immense quantity of thermal energy has already been lost and never recorded. At sector scale this represents a vast body of unrecognized environmental liability sitting unexamined in the public record. Bedrock FAD is the instrument that discovers it — methodically, forensically, and without permission — and routes it into a system that can prove and settle it. The record was always there. Until now, no one was reading it.
