

Bedrock ESG Troubleshooting Guide

Resolving Wallet & Blockchain Verification Errors

The Foundation Rule of Troubleshooting

Your configuration is sound—adjustments are straightforward.

Blockchain verification errors almost always appear more complex than they actually are. In practice, 95% of issues encountered are simple **configuration alignments**—your wallet is connected to a different network, or your browser session needs renewal. The verification infrastructure remains stable; it requires only correct input parameters.

Consider it similar to industrial equipment calibration. The machinery functions correctly—it simply needs proper settings to operate as designed. That’s exactly what we’ll address here.

Common Issues & Resolutions

Use the table below to locate your error condition and follow the resolution protocol. If your exact error isn’t listed, identify the most similar condition.

Common Issue	Technical Context	Resolution Protocol
“Account does not exist”	Your wallet address hasn’t been initialized on the Solana network. Wallet addresses require minimal SOL balance to become active network participants.	 Acquire initialization SOL. See the “Acquiring Test SOL” section below. Once you have 0.001+ SOL, this condition resolves automatically.
“Network mismatch” or missing transactions	You’re viewing one network (e.g., Mainnet) while your wallet is connected to a different network (e.g., Devnet). This is equivalent to searching records in the wrong database.	 Align network configurations. Access your wallet settings and verify network selection. Ensure Bedrock ESG and your wallet both reference the same network (Devnet for testing, Mainnet for production attestations).
“Insufficient SOL for transaction”	Solana transactions require minimal processing fees (typically less than \$0.01). Your wallet balance doesn’t cover the required amount.	 Fund your wallet. For testing, use a faucet (see below). For production, acquire SOL from a licensed exchange and transfer to your wallet.
Faucet returns “Rate limit exceeded”	Free SOL faucets implement rate limiting. Too many requests have been processed recently.	 Observe cooldown period. Wait 15-30 minutes, then retry. Alternatively, utilize a different faucet (options listed below).
“Wallet not connected” or connection timeout	Your browser lost the secure connection to your wallet extension, or the session expired.	 Reestablish connection. Click Connect Wallet in Bedrock ESG. If unsuccessful, refresh the page, unlock your wallet extension, and retry.
“User rejected the request”	You (or your wallet security) declined the transaction before execution. This is a security feature, not an error condition.	 Retry with approval. Repeat the action and select Approve or Confirm in the wallet confirmation dialog.
Transaction status “Pending” extended	Network congestion or transaction queue delays may occur during high-volume periods.	 Allow processing time. Most transactions confirm within seconds, but network load can extend this. If exceeding 5 minutes, retry the

Common Issue	Technical Context	Resolution Protocol
		action—Solana prevents duplicate charges.
“Blockhash expired” or “Transaction expired”	Solana transactions have a validation window (~60 seconds). Extended approval time caused timeout.	✅ Retry promptly. Initiate the action again and approve the wallet confirmation within 30 seconds.
Wallet confirmation dialog not appearing	Browser popup controls or wallet extension status may be blocking the dialog.	✅ Verify popup permissions. Click your wallet extension icon to check for pending requests. If none exist, refresh the page and retry. Ensure your wallet extension is unlocked.
“Simulation failed” prior to transaction	Solana validates transactions before execution. Something in the current state would cause execution failure.	✅ Verify input parameters. Confirm sufficient SOL balance, correct network selection, and valid submission data. Retry after corrections.

Acquiring Test SOL (Devnet Environment)

⚠️ **Important:** Test SOL (Devnet/Testnet) has **no monetary value**. It exists solely for development and testing purposes. Never exchange real currency for test tokens.

Protocol: Acquire Free Devnet SOL

1. Copy your wallet address

Open your wallet application (Phantom, Solflare, etc.) and copy your public address. Format:

```
7xKX...n9Dp
```

2. Access a Solana Faucet

Visit one of these verified faucets:

- [Official Solana Faucet](https://faucet.solana.com/) (https://faucet.solana.com/) — Primary source
- [SolFaucet](https://solfaucet.com/) (https://solfaucet.com/) — Alternative source

3. Submit your address and request SOL

Enter your wallet address and select **Request Airdrop** or **Get SOL**.

4. Allow 10-30 seconds for processing

Check your wallet balance. You should see 1-2 SOL credited.

✅ **Initialization complete.** Your wallet is now activated and funded for testing operations.

The Verification Protocol

When uncertain, verify on the authoritative source.

If you're unclear whether an attestation was successfully recorded, don't assume—verify using the official Solana Explorer. This is the sole authoritative source showing the **actual** blockchain state.

How to Verify Your Attestation

1. Locate your transaction signature (hash)

After generating an attestation or submitting data, Bedrock ESG displays a transaction signature. Format: `4sGj...Lp9x`. Copy this identifier.

2. Access Solana Explorer

Open <https://explorer.solana.com/> (<https://explorer.solana.com/>)

3. ⚠️ Select the correct network (CRITICAL)

- Locate the **network selector** in the top-right corner
- Click the dropdown menu
- Select **the identical network your wallet is configured to**:
 - `Devnet` for testing environment
 - `Mainnet Beta` for production attestations
 - **Network mismatch will result in “not found” responses.**

4. Enter your transaction signature

Input the signature in the search field and press Enter.

5. Interpret the result

- ✅ **“Success”** — Your attestation is confirmed and permanently recorded.
- ❌ **“Failed”** — An error occurred. Review the error details for specifics.
- 🔍 **“Not found”** — Either incorrect network is selected, or the transaction was never submitted.

Professional Tip: Bookmark Your Wallet Address

You can also search for your **wallet address** on the Explorer to view all historical transactions. This provides a comprehensive audit trail of your Bedrock ESG verification activity.

Standard Resolution Protocol

Before contacting support, execute these standard resolution steps:

1. 🔄 **Refresh the page** — Resolves approximately 50% of issues.
 2. 🔓 **Unlock your wallet** — Locked wallets cannot authorize transactions.
 3. 🌐 **Verify network alignment** — Ensure wallet and Bedrock ESG reference the same network.
 4. 💰 **Verify SOL balance** — Minimal balance required for transaction processing.
 5. 🧹 **Clear browser cache** — Cached data occasionally causes conflicts.
 6. 🔄 **Disconnect and reconnect wallet** — Fresh connections often resolve state issues.
-

Understanding Solana Networks

Network	Purpose	SOL Value	Use Case
Mainnet Beta	Production attestations	Real value	Live verification, institutional carbon attestations
Devnet	Testing & development	No value	System testing, feature validation
Testnet	Validator testing	No value	Infrastructure testing (not typically used by standard users)

Bedrock ESG defaults to Devnet for testing and onboarding. When your organization is ready for production attestations, configuration switches to Mainnet.

Glossary: Verification Terms Defined

Term	Definition
Wallet	Your digital identity and transaction authorization mechanism. Equivalent to a secure credential + payment instrument.
SOL	Solana's native currency. Minimal amounts required for transaction processing fees.
Transaction	Any blockchain operation—generating attestations, transferring credentials, etc.
Signature/Hash	A unique identifier for every transaction. Use for verification and audit purposes.
Faucet	A distribution mechanism for test tokens. Operates only on non-production networks.
Network	The Solana environment in use (Mainnet = production, Devnet = testing).
Blockhash	A time-limited validation token. Extended approval delays require new authorization.
Memo Program	The Solana capability Bedrock ESG utilizes for recording audit attestations on-chain.

Need Additional Support?

If standard resolution protocols haven't addressed your issue, our institutional support team is available.

 **Email:** support@bedrock-esg.io

 **Full Documentation:** docs.bedrock-esg.io (<https://docs.bedrock-esg.io>)

 **Professional Support:** Contact your designated verification agent

When contacting support, please provide:

- Your wallet address (public address only—never share your seed phrase)
- The exact error message displayed
- Network configuration (Devnet or Mainnet)
- The specific operation you were performing

Industrial-grade verification infrastructure. Built for trust.
